Topic 10 | Assessment Evidence

Building Production-Ready API Integration Projects

n8n workflow testing and authenticated webhook demonstration. Evidence is drawn from the screenshots shared during the implementation on 30 October 2026.

Evidence summary

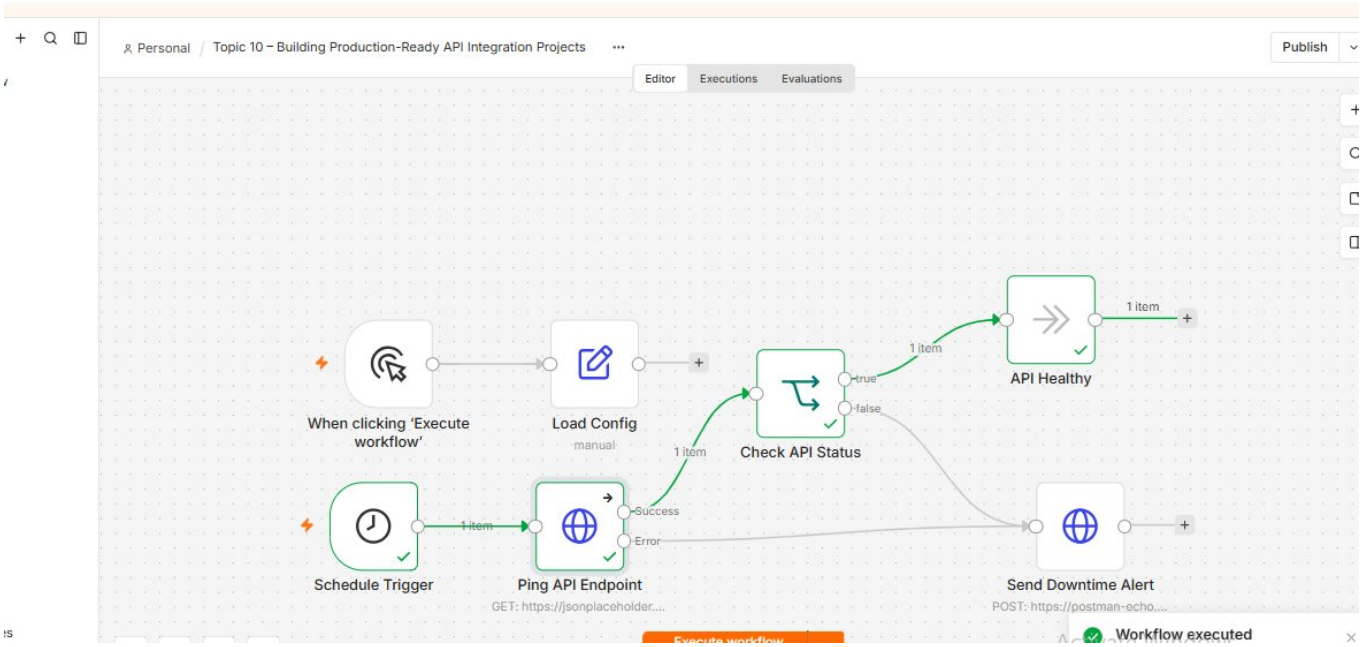

Test	Observed result
Configuration branch	One item; development configuration loaded
Uptime success path	HTTP 200 routed to API Healthy
Downtime test	HTTP 404 error routed to alert; echo POST succeeded
Unauthorized webhook	HTTP 403 Forbidden
Authorized webhook	HTTP 200 OK with accepted JSON response

Implementation boundaries

This is a tested development implementation. Environment variables were blocked, cryptographic signature verification was not demonstrated, and Postman Echo is an alert test endpoint rather than a real notification channel. The workflow JSON was exported by the author but not available for independent inspection.

Healthy API path

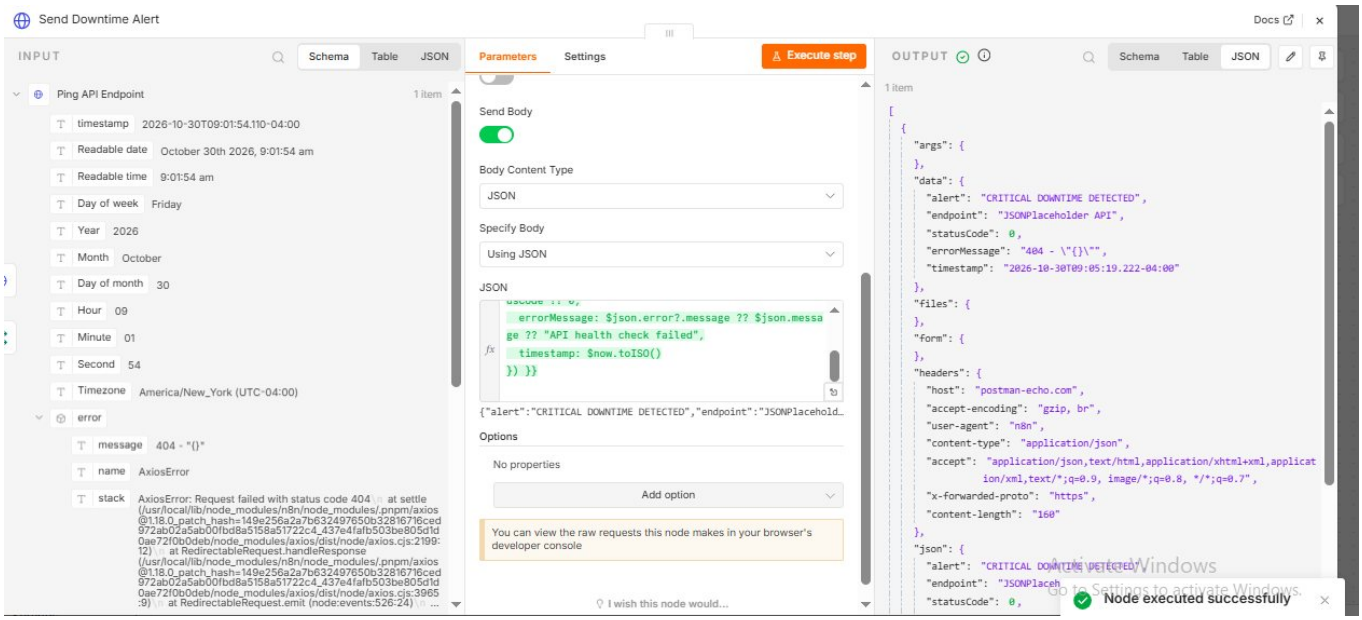

Schedule Trigger, Ping API Endpoint, Check API Status, and API Healthy are green; the true path received one item.

Evidence: user-provided n8n / Postman screenshot. Authentication values are redacted where visible.

Downtime alert POST

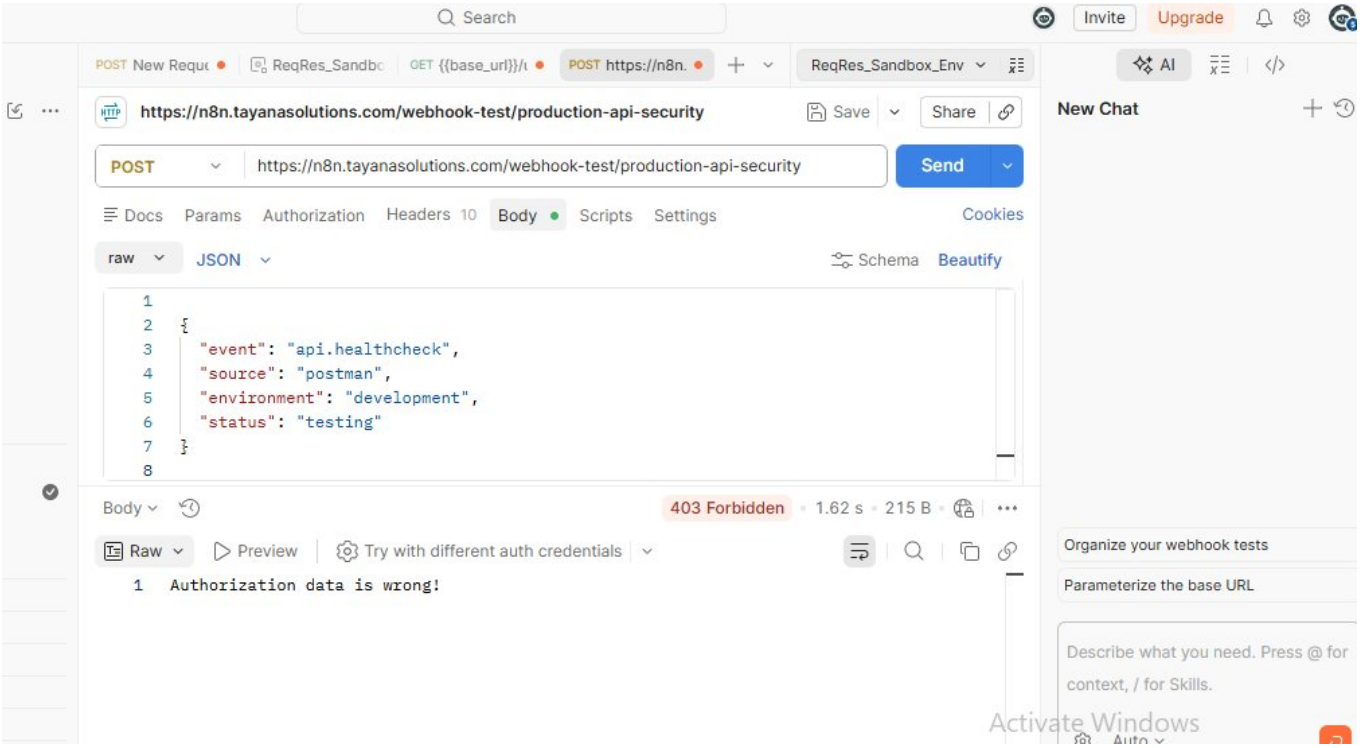

The alert node successfully posted the failure payload to Postman Echo. The payload includes a 404 error message, although statusCode is 0.

Evidence: user-provided n8n / Postman screenshot. Authentication values are redacted where visible.

Unauthorized webhook test

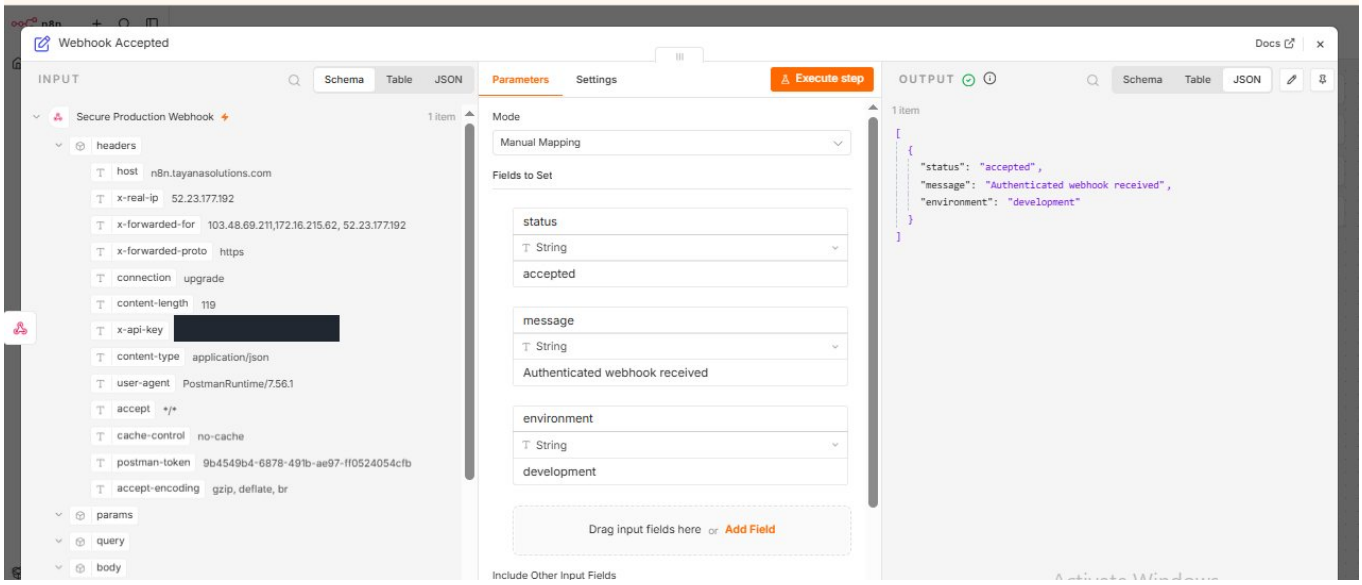

Postman returned HTTP 403 Forbidden for a request that failed header authentication.

Evidence: user-provided n8n / Postman screenshot. Authentication values are redacted where visible.

Authenticated webhook processing

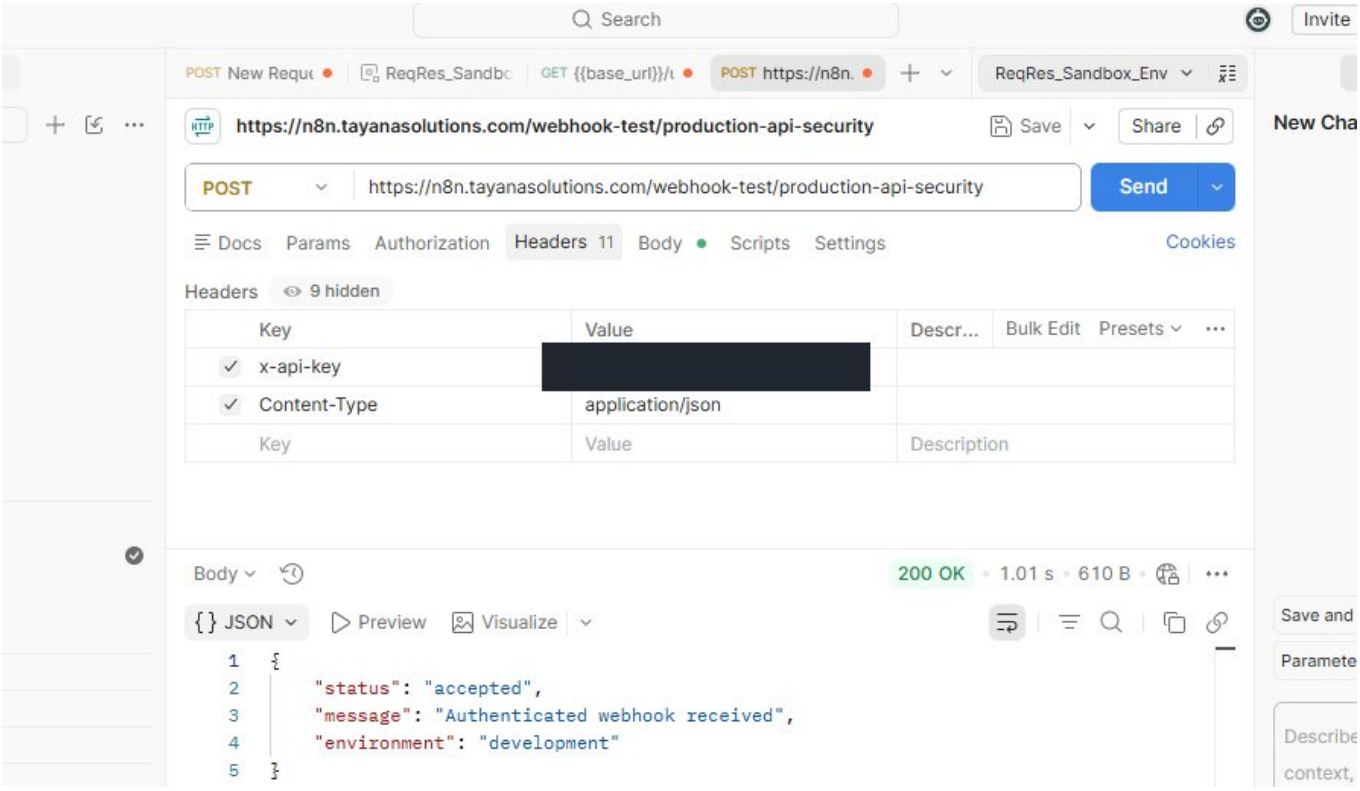

The Webhook Accepted node executed successfully and returned the expected accepted/development fields.

Evidence: user-provided n8n / Postman screenshot. Authentication values are redacted where visible.

Authorized Postman response

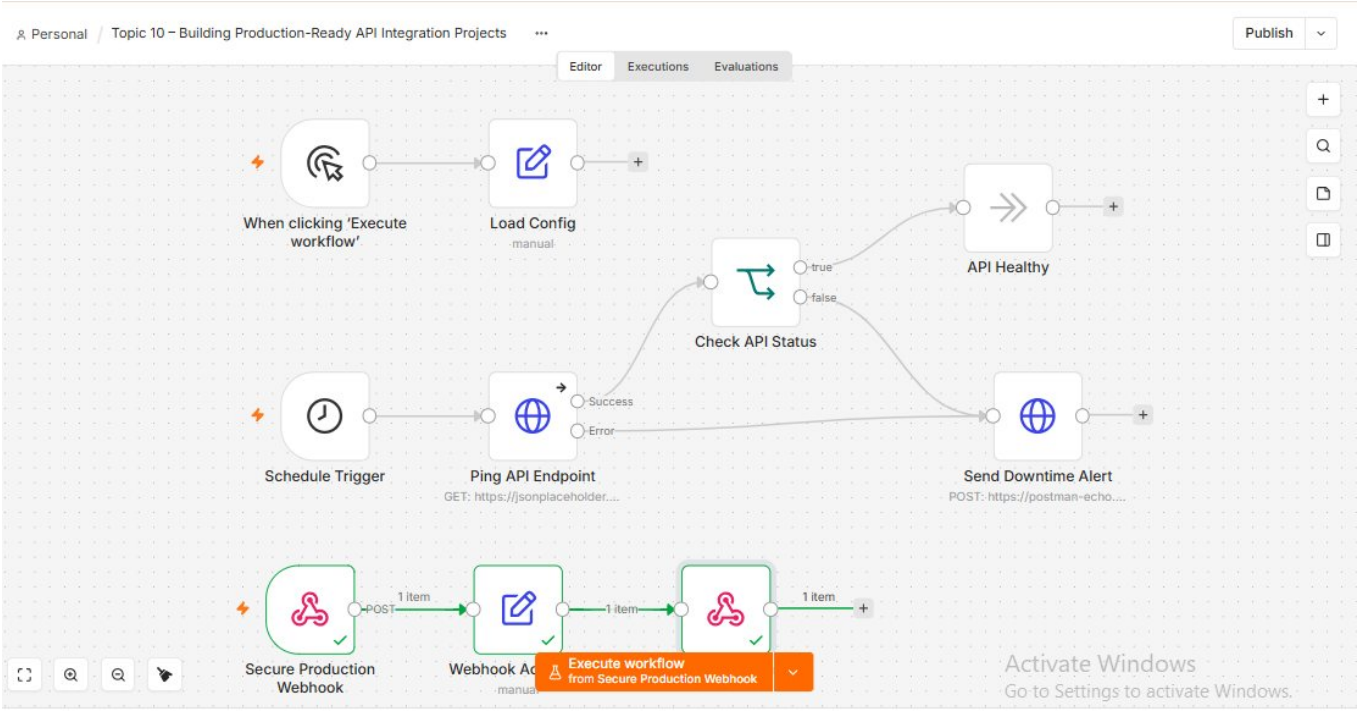

Postman returned HTTP 200 OK with the expected JSON acknowledgement.

Evidence: user-provided n8n / Postman screenshot. Authentication values are redacted where visible.

Final workflow canvas

All three branches are visible: Load Config, uptime monitoring, and authenticated webhook response.

Evidence: user-provided n8n / Postman screenshot. Authentication values are redacted where visible.
